

Petroleum geosciences

Applied graduate studies

Language:
English

Duration:
16 months

Want to become a key actor in subsurface management issues and play a significant role in the energy transition? Our

Petroleum Geosciences program has been completely revised to offer a cutting-edge and integrated training in geosciences and reservoir engineering, combining fundamental courses with practice on multidisciplinary industry case studies. You'll be immediately operational upon graduation. A single training course for a multitude of current and future job prospects: don't wait, join us today!

IFP School's Master's degree/ Specialized engineering degree (Diplôme d'ingénieur spécialisé)

The energy world is completely reshaped through the need to meet net zero carbon emissions by 2050 for preventing extreme climate changes. At the same time, the energy demand continues growing to accompany the development of many countries across the planet. In this context, the subsurface has to play a key role to help decarbonizing the energy mix, for example with the development of geothermal energy, geological sequestration of CO₂, and underground energy storage. Besides such new usages of the subsurface, the exploitation of oil and gas will remain significant in the energy mix for the coming years.

The tools and technology used to characterize, model and monitor the subsurface are essential in any underground project (hydrocarbon exploitation, gas and hydrogen storage, geothermal project, etc.). Hence, the expertise of geoscientists and reservoir engineers are key factors of success.

The Petroleum Geosciences program has entirely been revisited to enhance your competencies in reservoir engineering together with geosciences, incorporating new disciplines that will be necessary to deal with any subsurface project: geomatics, geomechanics, data sciences.

The new content consists of a common core, including the necessary concepts and technologies in the various disciplines which are essential to evaluate and develop a subsurface-related project; it is followed by a topic-specific option that focuses on the emerging usages of the subsurface for the energy transition. Each of these options is based on a specific case study from the industry, and being supported by topic-specific courses.

The integrated case study supporting each topic-specific option will allow you to apply the tools learned during the common core such as reservoir characterization, geological modeling, advanced reservoir simulation, production monitoring and optimization.

The courses will be supported by practice on case studies using up-to-date software.

CAREER OPPORTUNITIES

Wide range of international opportunities:

- Reservoir geoscientist
- Exploration geoscientist
- Reservoir engineer
- Geodata scientist

The topic-specific options will be mostly teamwork where you will be an active player of a multidisciplinary team, increasing your know-how in the management of an integrated subsurface project.

IFP School is a cosmopolitan environment with students coming from every continent. We firmly believe that such a cultural blend stimulates student and faculty dynamics.

HIGHLIGHTS

- Customizable academic path with different topic-specific options covering the various usages of the subsurface for energy transition including a path to the regional assessment of georesources
- Multidisciplinary teamwork on real case studies provided by the industry
- High-tech tools and advanced workflows for exploration and exploitation of georesources
- Lectures by the best professional specialists
- Various field courses.

Typical class profile/main sponsors

Students in this program are almost all sponsored by companies (through sponsorships, apprenticeships, or study leaves) that finance their living expenses during the academic period and contribute towards their tuition.

Supporting companies include national and international energy companies, engineering and service companies of the energy sector, consulting companies, international institutions as well as geothermal and underground storage companies.

Program content

Common core ~2/3 of the academic cursus

<ul style="list-style-type: none"> • Introduction to basin studies • Reservoir geology • Static modeling on a case study 	<ul style="list-style-type: none"> • Reserves estimation
<ul style="list-style-type: none"> • Petrophysics & rock physics • Well logging • Geomechanics • Geostatistics • Data analytics & machine learning • Geographic Information System (GIS) 	<ul style="list-style-type: none"> • Pressure - Volume - Temperature (PVT) • Well testing • Production mechanisms • Reservoir simulation on a case study
	<ul style="list-style-type: none"> • Geophysical methods overview • Seismic interpretation • Geophysical monitoring

Topic-specific options ~ 1/3 of the academic cursus

<p>One topic to be selected among:</p> <ul style="list-style-type: none"> • Regional assessment of subsurface resources • Underground gas storage • Geothermal energy

Program schedule

The two examples of schedules shown below correspond to the most frequently encountered cases for students in this program: a 16-month continuous program for students with a 4- or 5-year degree, and an alternating school/company 16-month program for students with a 5-year engineering degree.

16 months

Continuous program

16 months

Alternating school/company program

● IFP School ● Company

Another possible case:

• **22-month alternating school/company program** for students in their penultimate year of a major European school or university having signed a double-degree agreement with IFP School.
